

Instruction to execute project

In this document, we will illustrate the process of executing our project.

1. To match the requirement of client and server with socket, one need to start the MySQL server first. Then, run the Driver in eclipse. After the above process, the server side has been configured and will be waiting for connecting from the client side in Android.
2. For the Android side, one just need to install our project into an Android device to execute our project.
